SECTION 1: OVERVIEW

PROJECT NAME: USGS OLYMPIC PENINSULA WA QL1 LIDAR

WOOLPERT PROJECT #73622

This report contains a comprehensive outline of the Olympic Peninsula WA QL1 LiDAR Processing task order for the United States Geological Survey (USGS). This task is issued under Contract Number G10PC00057, as task order number G13PD00849. The project area covers approximately 437 square miles along with a 100 meter buffer of the Olympic Peninsula in the counties of Jefferson and Clallam in north-western coastal Washington. The LiDAR was collected and processed to meet a maximum Nominal Post Spacing (NPS) of 0.35 meters. The NPS assessment is made against single swath, first return data located within the geometrically usable center portion (typically ~90%) of each swath.

The data was collected using a combination of Leica ALS60 and ALS70 Multiple Pulses in Air (MPiA) LiDAR sensors mounted in a Partenavia aircraft.

The ALS60 sensor collects up to four returns per pulse, as well as intensity data, for the first three returns. If a fourth return was captured, the system does not record an associated intensity value. The aerial LiDAR was collected at the following sensor specifications:

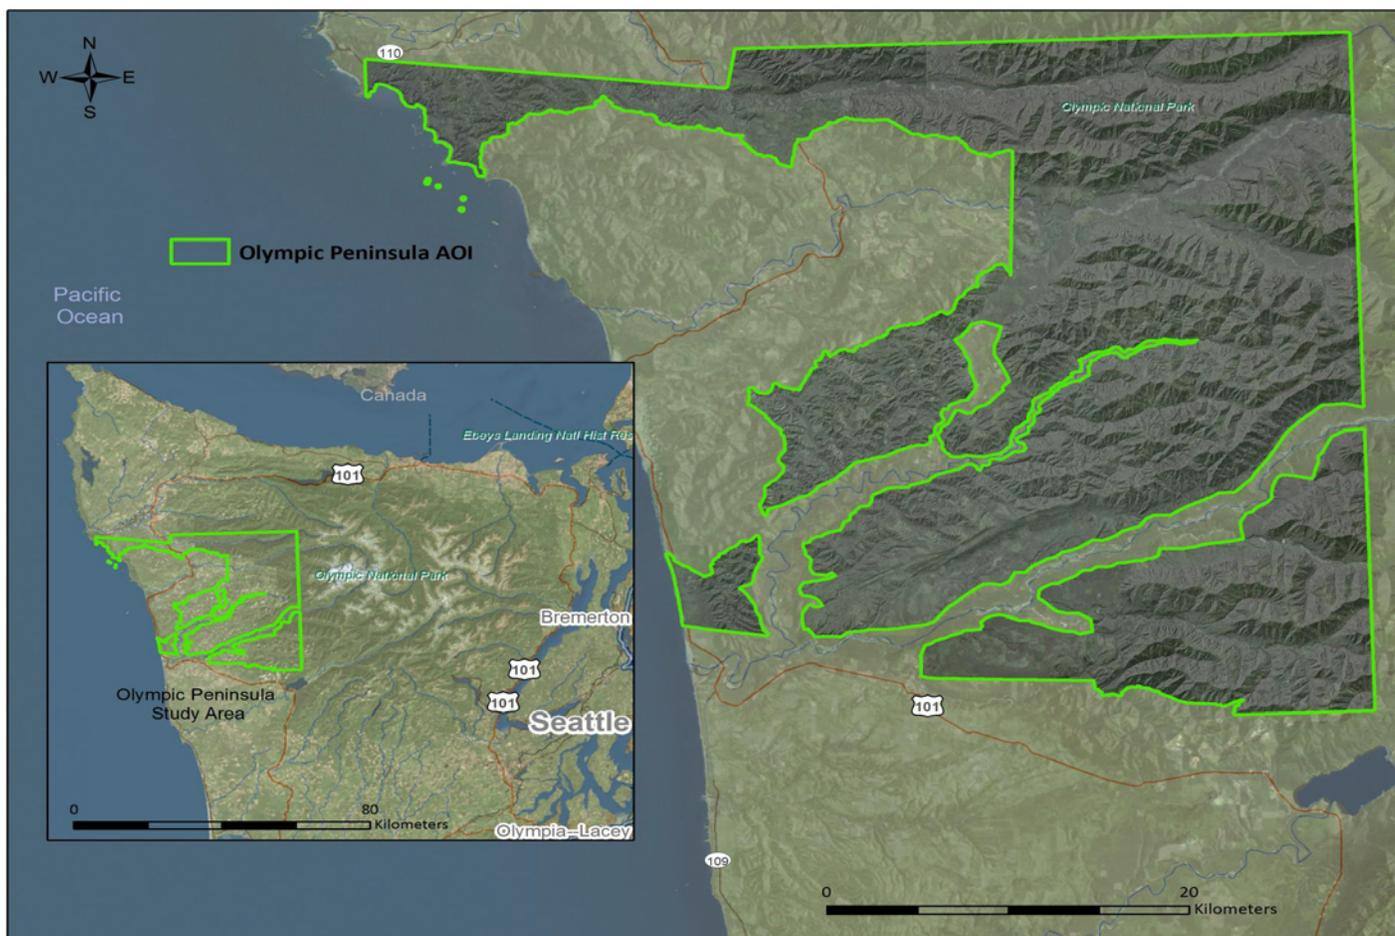

Post Spacing (Minimum):	1.15 ft. / 0.35m
AGL (Above Ground Level) average flying height:	2,953 ft. / 900 m
MSL (Mean Sea Level) average flying height:	variable
Average Ground Speed:	variable
Field of View (full):	28 degrees
Pulse Rate:	95-106 kHz
Scan Rate:	63.6 Hz
Side Lap (Average):	50%

The ALS70 sensor collects up to four returns per pulse, as well as intensity data, for the first three returns. If a fourth return was captured, the system does not record an associated intensity value. The aerial LiDAR was collected at the following sensor specifications:

Post Spacing (Minimum):	1.15 ft. / 0.35m
AGL (Above Ground Level) average flying height:	4,265 ft. / 1,300 m
MSL (Mean Sea Level) average flying height:	variable
Average Ground Speed:	variable
Field of View (full):	28-30 degrees
Pulse Rate:	180-199 kHz
Scan Rate:	41.7 Hz
Side Lap (Average):	50%

The LiDAR data was processed and projected in UTM, Zone 10, North American Datum of 1983 (2011) in units of meters. The vertical datum used for the task order was referenced to NAVD 1988, GEOID12A, in units of meters. In addition, a second data set covering the same AOI was processed in Washington State Plane South Zone, North American Datum of 1983 (HARN) in units of survey feet. The vertical datum used for this was referenced to NAVD 1988, GEOID12A, in units of survey feet.

SECTION 2: ACQUISITION

The data was collected using a combination of Leica ALS60 and ALS70 Multiple Pulses in Air (MPiA) LiDAR sensors mounted in a Partenavia aircraft.

In preparation for data collection, the contractor reviewed the project area and developed a specialized flight plan to ensure complete coverage of the Olympic Peninsula LiDAR study area at the target point density of ≥ 8.0 points/m² (0.74 points/ft²). Acquisition parameters including orientation relative to terrain, flight altitude, pulse rate, scan angle, and ground speed were adapted to optimize flight paths and flight times while meeting all contract specifications.

Factors such as satellite constellation availability and weather windows must be considered during the planning stage. Any weather hazards or conditions affecting the flight were continuously monitored due to their potential impact on the daily success of airborne and ground operations. In addition, logistical considerations including private property access and potential air space restrictions were reviewed.

All areas were surveyed with an opposing flight line side-lap of $\geq 50\%$ ($\geq 100\%$ overlap) in order to reduce laser shadowing and increase surface laser painting. To accurately solve for laser point position (geographic coordinates x, y and z), the positional coordinates of the airborne sensor and the attitude of the aircraft were recorded continuously throughout the LiDAR data collection mission. Position of the aircraft was measured twice per second (2 Hz) by an onboard differential GPS unit, and aircraft attitude was measured 200 times per second (200 Hz) as pitch, roll and yaw (heading) from an onboard inertial measurement unit (IMU). To allow for post-processing correction and calibration, aircraft and sensor position and attitude data are indexed by GPS time.

The LiDAR data was collected in twenty-one (21) separate missions, flown as close together as the weather permitted, to ensure consistent ground conditions across the project area.

An initial quality control process was performed immediately on the LiDAR data to review the data coverage, airborne GPS data, and trajectory solution. Any gaps found in the LiDAR data were relayed to the flight crew, and the area was re-flown.

SECTION 3: LIDAR DATA PROCESSING

APPLICATIONS AND WORK FLOW OVERVIEW

1. Resolve kinematic corrections for aircraft position data using kinematic aircraft GPS and static ground GPS data. Develop a smoothed best estimate of trajectory (SBET) file that blends post-processed aircraft position with sensor head position and attitude recorded throughout the survey.
Software: IPAS TC v3.1, Waypoint GPS v8.3, Trimble Business Center v3.00, Graphic Calculator 2013.
2. Calculate laser point position by associating SBET position to each laser point return time, scan angle, intensity, etc. Create raw laser point cloud data for the entire survey in *.las (ASPRS v. 1.2) format. Convert data to orthometric elevations by applying a Geoid12A correction.
Software: ALS Post Processing Software v.2.74.
3. Import raw laser points into manageable blocks (less than 500 MB) to perform manual relative accuracy calibration and filter erroneous points. Classify ground points for individual flight lines.
Software: TerraScan v.14.
4. Using ground classified points per each flight line, test the relative accuracy. Perform automated line-to-line calibrations for system attitude parameters (pitch, roll, heading), mirror flex (scale) and GPS/IMU drift. Calculate calibrations on ground classified points from paired flight lines and apply results to all points in a flight line. Use every flight line for relative accuracy calibration.
Software: TerraScan v.14.
5. Classify resulting data to ground and other client designated ASPRS classifications. Assess statistical absolute accuracy via direct comparisons of ground classified points to ground control survey data
Software: TerraScan v.14, TerraModeler v.14.
6. Generate bare earth models as triangulated surfaces. Generate highest hit models as a surface expression of all classified points. Export all surface models as 1m EDRAS Imagine (.img) files and 3 ft ESRI Grids.
Software: TerraScan v.14, TerraModeler v14, ArcMap v10.1
7. Export intensity images as GeoTIFFs at 1m and 3ft pixel resolutions
Software: TerraScan v.14, TerraModeler v14, ArcMap v10.1

LIDAR DATA PROCESSING

When the sensor calibration, data acquisition, and GPS processing phases were complete, the formal data reduction processes included:

- Processed individual flight lines to derive a raw “Point Cloud” LAS file. Matched overlapping flight lines, generated statistics for evaluation comparisons, and made the necessary adjustments to remove any residual systematic error.

- Calibrated LAS files were imported into the task order tiles and initially filtered to create a ground and non-ground class. Then additional classes were filtered as necessary to meet client specified classes.
- Once all project data was imported and classified, survey ground control data was imported and calculated for an accuracy assessment. As a QC measure, Woolpert has developed a routine to generate accuracy statistical reports by comparisons against the TIN and the DEM using surveyed ground control of higher accuracy. The LiDAR is adjusted accordingly to meet or exceed the vertical accuracy requirements.
- The LiDAR tiles were reviewed using a series of proprietary QA/QC procedures to ensure it fulfills the task order requirements. A portion of this requires a manual step to ensure anomalies have been removed from the ground class.
- The LiDAR LAS files are classified into the Default (Class 1), Ground (Class 2), Noise (Class 7), Water (Class 9), Ignored Ground (Class 10) classifications.
- FGDC Compliant metadata was developed for the task order in .xml format for the final data products.
- The horizontal datum used for the task order was referenced to UTM, Zone 10, North American Datum of 1983 (2011) in units of meters. The vertical datum used for the task order was referenced to NAVD88, GEOID12A, in units of meters. In addition, a second data set covering the same AOI was processed in Washington State Plane South Zone, North American Datum of 1983 (HARN) in units of survey feet. The vertical datum used for this was referenced to NAVD 1988, GEOID12A, in units of survey feet.

SECTION 4: HYDROLOGIC FLATTENING

HYDROLOGIC FLATTENING OF LIDAR DEM DATA

Olympic Peninsula WA QL1 LiDAR Processing task order required the compilation of breaklines defining water bodies and rivers. The breaklines were used to perform the hydrologic flattening of water bodies, and gradient hydrologic flattening of double line streams and rivers. Lakes, reservoirs and ponds, at a minimum size of 2-acres or greater, were compiled as closed polygons. The closed water bodies were collected at a constant elevation. Rivers and streams, at a nominal minimum width of 30.5 meters (100 feet), were compiled in the direction of flow with both sides of the stream maintaining an equal gradient elevation.

LIDAR DATA REVIEW AND PROCESSING

The following steps were utilized to hydrologically flatten the water bodies and for gradient hydrologic flattening of the double line streams within the existing LiDAR data.

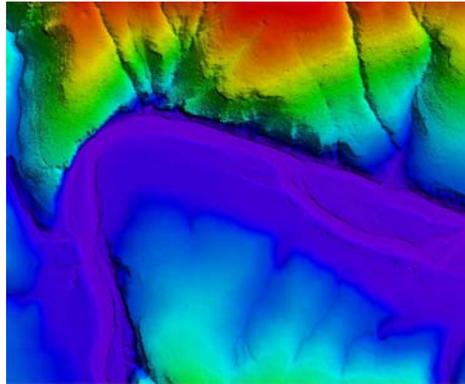

Lakes and other closed water bodies within the study area that met a minimum area of 2 acres or streams that met a minimum width of 100-ft were flattened to a consistent water level. The hydro-flattening process eliminates artifacts in the digital terrain model caused by both increased variability in ranges or dropouts in laser returns due to the low reflectivity of water.

Hydro-flattening of closed water bodies was performed using a combination of automated and manual detection and adjustment techniques designed to identify water boundaries and levels. Water boundary polygons were developed using an algorithm which weights LiDAR-derived slopes, intensities, and return densities to detect the water's edge. Water's edge polygons were then manually reviewed and edited as necessary.

Once polygons were developed, water elevations were obtained from the filtered LiDAR returns. Lakes were assigned a consistent elevation for an entire polygon while rivers were assigned consistent elevations on opposing banks and smoothed to ensure downstream flow through the entire river channel. The initial ground classified points falling within water polygons were reclassified as water points to omit them from the final ground model.

Water's edge breaklines were then incorporated into the hydro-flattened DEM by enforcing triangle edges (adjacent to the breakline) to the elevation values of the breakline. This implementation corrected interpolation along the hard edge. Water surfaces were obtained from a TIN of the 3-D water's edge breaklines resulting in the final hydro flattened model ([Figure 4.1](#)).

Figure 4.1

1. All ground points were reclassified from inside the hydrologic feature polygons to water, class nine (9).
2. All ground points were reclassified from within a buffer along the hydrologic feature breaklines to buffered ground, class ten (10).
3. The LiDAR ground points and hydrologic feature breaklines were used to generate a new digital elevation model (DEM).

Figure 4.2

Figure 4.3

Figure 4.2 reflects a DEM generated from original LiDAR bare earth point data prior to the hydrologic flattening process. Note the "tinning" across the lake surface.

Figure 4.3 reflects a DEM generated from LiDAR with breaklines compiled to define the hydrologic features. This figure illustrates the results of adding the breaklines to hydrologically flatten the DEM data. Note the smooth appearance of the lake surface in the DEM.

Terrascan was used to add the hydrologic breakline vertices and export the lattice models. The hydrologically flattened DEM data was provided to USGS in ERDAS .IMG format at a 1-meter cell size. In addition, the hydrologically flattened DEM data was provided to the USGS in ESRI ArcGrid format at a 3-

foot cell size.

The hydrologic breaklines compiled as part of the flattening process were provided to the USGS as an ESRI shapefile. The breaklines defining the water bodies greater than 2-acres were provided as a PolygonZ file. The breaklines compiled for the gradient flattening of all rivers and streams at a nominal minimum width of 30.5 meters (100 feet) were provided as a PolylineZ file.

DATA QA/QC

Initial QA/QC for this task order was performed in Global Mapper v15, by reviewing the grids and hydrologic breakline features. Additionally, ESRI software and proprietary methods were used to review the overall connectivity of the hydrologic breaklines.

Edits and corrections were addressed individually by tile. If a water body breakline needed to be adjusted to improve the flattening of the DEM data, the area was cross referenced by tile number, corrected accordingly, a new DEM file was regenerated and reviewed.

SECTION 5: FINAL ACCURACY ASSESSMENT

FINAL VERTICAL ACCURACY ASSESSMENT

The vertical accuracy statistics were calculated by comparison of the LiDAR bare earth points to the ground surveyed quality check points.
