# Section 1: Overview

Project Name: Mississippi Coastal QL2 Lidar with 3DEP Extension

Project: # 75157

This report contains a comprehensive outline of the Mississippi Coastal QL2 Lidar with 3DEP Extension Lidar Processing task order for the United States Geological Survey (USGS). This task is issued under USGS Contract No. G10PC00057, Task Order No. G15PD00091. This task order requires lidar data to be acquired over approximately 5981 square miles. The lidar was collected and processed to meet a maximum Nominal Post Spacing (NPS) of 0.7 meter. The NPS assessment is made against single swath, first return data located within the geometrically usable center portion (typically ~90%) of each swath.

The data was collected using a Leica ALS70 500 kHz Multiple Pulses in Air (MPiA) lidar sensor and a Chiroptera II sensor.

**The ALS70 sensor** collects up to four returns per pulse, as well as intensity data, for the first three returns. If a fourth return was captured, the system does not record an associated intensity value. The aerial lidar was collected at the following sensor specifications:

| <b>Table 1.1: ALS70 Specifications</b>         |                     |
|--|---------------------|
| Post Spacing                                   | 2.3ft / 0.7 m       |
| AGL (Above Ground Level) average flying height | 6,500 ft / 1,981 m  |
| MSL (Mean Sea Level) average flying height     | varies              |
| Average Ground Speed:                          | 150 knots / 173 mph |
| Field of View (full)                           | 40 degrees          |
| Pulse Rate                                     | 272 kHz             |
| Scan Rate                                      | 41.0 Hz             |
| Side Lap                                       | 20%                 |

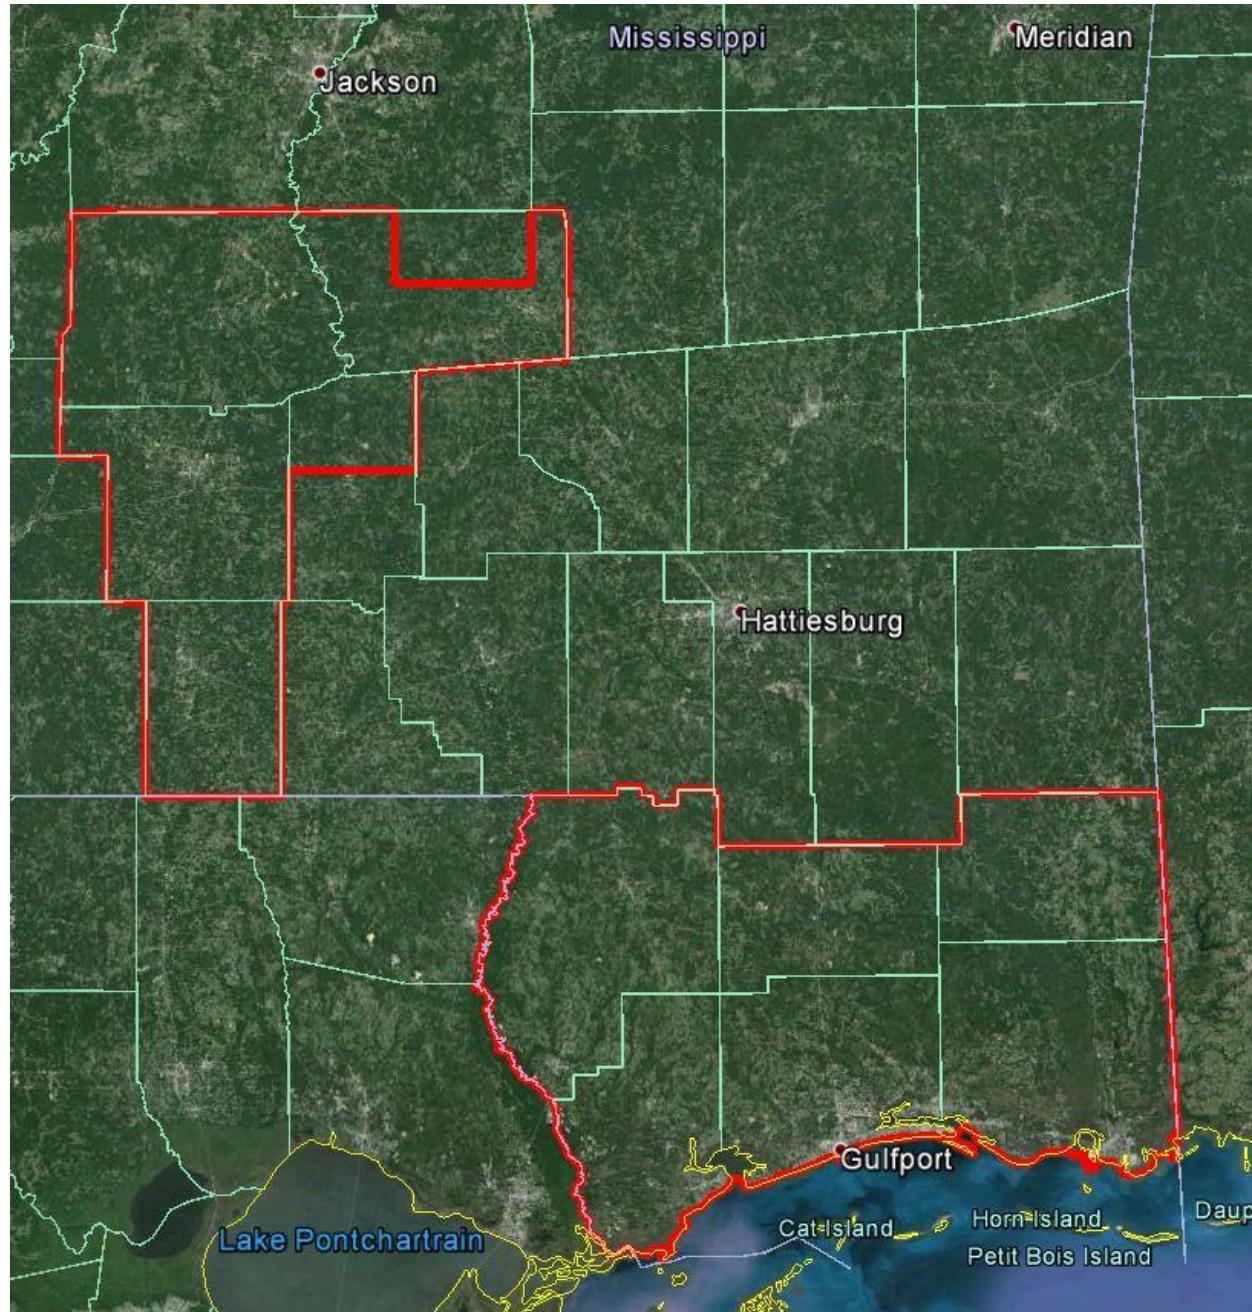

**The Chiroptera II sensor** provides 35 kHz bathymetric data and up to 500 kHz topographic data. The system acquires bathymetric lidar, topographic lidar and 4-band 80 MP digital camera imagery simultaneously. For this project, the flight parameters were used to provide 100% coverage. Two multiple pulse in air zones were used.

| <b>Table 1.2: Chiroptera II Specifications</b> |           |
|--|-----------|
|  | All Areas |
| <b>Topo Points per m<sup>2</sup></b>           | 4         |
| <b>Swath Width (m)</b>                         | 700       |
| <b>Flight Line Sidelap (%)</b>                 | 15        |
| <b>Altitude (m)</b>                            | 1000      |
| <b>Survey Speed (knots)</b>                    | 125       |
| <b>Topo PRF (kHz)</b>                          | 250       |
| <b>Mirror Speed (RPM)</b>                      | 3805      |
| <b>Peak Threshold (Samples)</b>                | 300       |
| <b>Pulse Energy (μJ)</b>                       | 36        |

The 3DEP Extension data was processed and projected in UTM, Zone 15, North American Datum of 1983 (2011) and UTM, Zone 16, North American Datum of 1983 (2011) in units of meters. The vertical datum used for the task order was referenced to NAVD 1988, GEOID12A, in units of meters.

The Coastal delivery was processed and projected in Mississippi State Plane East Zone, NAD83(2011). The vertical datum used for the task order was referenced to NAVD88, GEOID12A/12B in units of US Survey Feet.

Figure 1.1: Lidar Task Order AOI

## Section 2: Acquisition

The existing lidar data was acquired on board Woolpert Cessna aircraft with a Leica ALS70 500 kHz Multiple Pulses in Air (MPiA) Lidar Sensor System and a Chiroptera II (CHII) sensor

**The ALS70 lidar system**, developed by Leica Geosystems of Heerbrugg, Switzerland, includes the simultaneous first, intermediate and last pulse data capture module, the extended altitude range module, and the target signal intensity capture module. The system software is operated on an OC50 Operation Controller aboard the aircraft.

The ALS70 500 kHz Multiple Pulses in Air (MPiA) Lidar System has the following specifications:

| <b>Table 2.1: ALS Lidar System Specifications</b> |  |
|---|--|
| Operating Altitude                                | 200 – 3,500 meters   |
| Scan Angle  | 0 to 75° (variable)  |
| Swath Width                                       | 0 to 1.5 X altitude (variable)                             |
| Scan Frequency                                    | 0 – 200 Hz (variable based on scan angle)                  |
| Maximum Pulse Rate                                | 500 kHz (Effective)  |
| Range Resolution                                  | Better than 1 cm   |
| Elevation Accuracy                                | 7 - 16 cm single shot (one standard deviation)             |
| Horizontal Accuracy                               | 5 – 38 cm (one standard deviation)                         |
| Number of Returns per Pulse                       | 7 (infinite)   |
| Number of Intensities                             | 3 (first, second, third)                                   |
| Intensity Digitization                            | 8 bit intensity + 8 bit AGC (Automatic Gain Control) level |
| MPiA (Multiple Pulses in Air)                     | 8 bits @ 1nsec interval @ 50kHz                            |
| Laser Beam Divergence                             | 0.22 mrad @ $1/e^2$ ( $\sim 0.15$ mrad @ $1/e$ )           |
| Laser Classification                              | Class IV laser product (FDA CFR 21)                        |
| Eye Safe Range                                    | 400m single shot depending on laser repetition rate        |
| Roll Stabilization                                | Automatic adaptive, range = 75 degrees minus current FOV   |
| Power Requirements                                | 28 VDC @ 25A   |
| Operating Temperature                             | 0-40°C   |
| Humidity  | 0-95% non-condensing                                       |
| Supported GNSS Receivers                          | Ashtech Z12, Trimble 7400, Novatel Millenium               |

**The Chiroptera II** sensor was mounted in a Leica PAV100 gyro-stabilized mount integrated with a NovAtel SPAN GNSS and LCI-100C IMU. Real time navigation and GNSS/IMU data logging was provided by Leica FlightPro software. Lidar data were logged on the Airborne Hydrography, AB (AHAB) operator console.

| <b>Table 2.2: Chiroptera II Laser Specifications</b> |                   |                     |
|--|-------------------|---------------------|
|  | Topographic Laser | Shallow Bathy Laser |
| <b>Wavelength</b>                                    | 1064nm            | 515nm               |
| <b>Pulse Length</b>                                  | 4 +/- 1ns         | 2.5 +/- 1ns         |
| <b>Beam Divergence</b>                               | 0.5mRad           | 4.5mRad             |
| <b>Pulse Duration</b>                                | 5ns               | 0.5ns               |

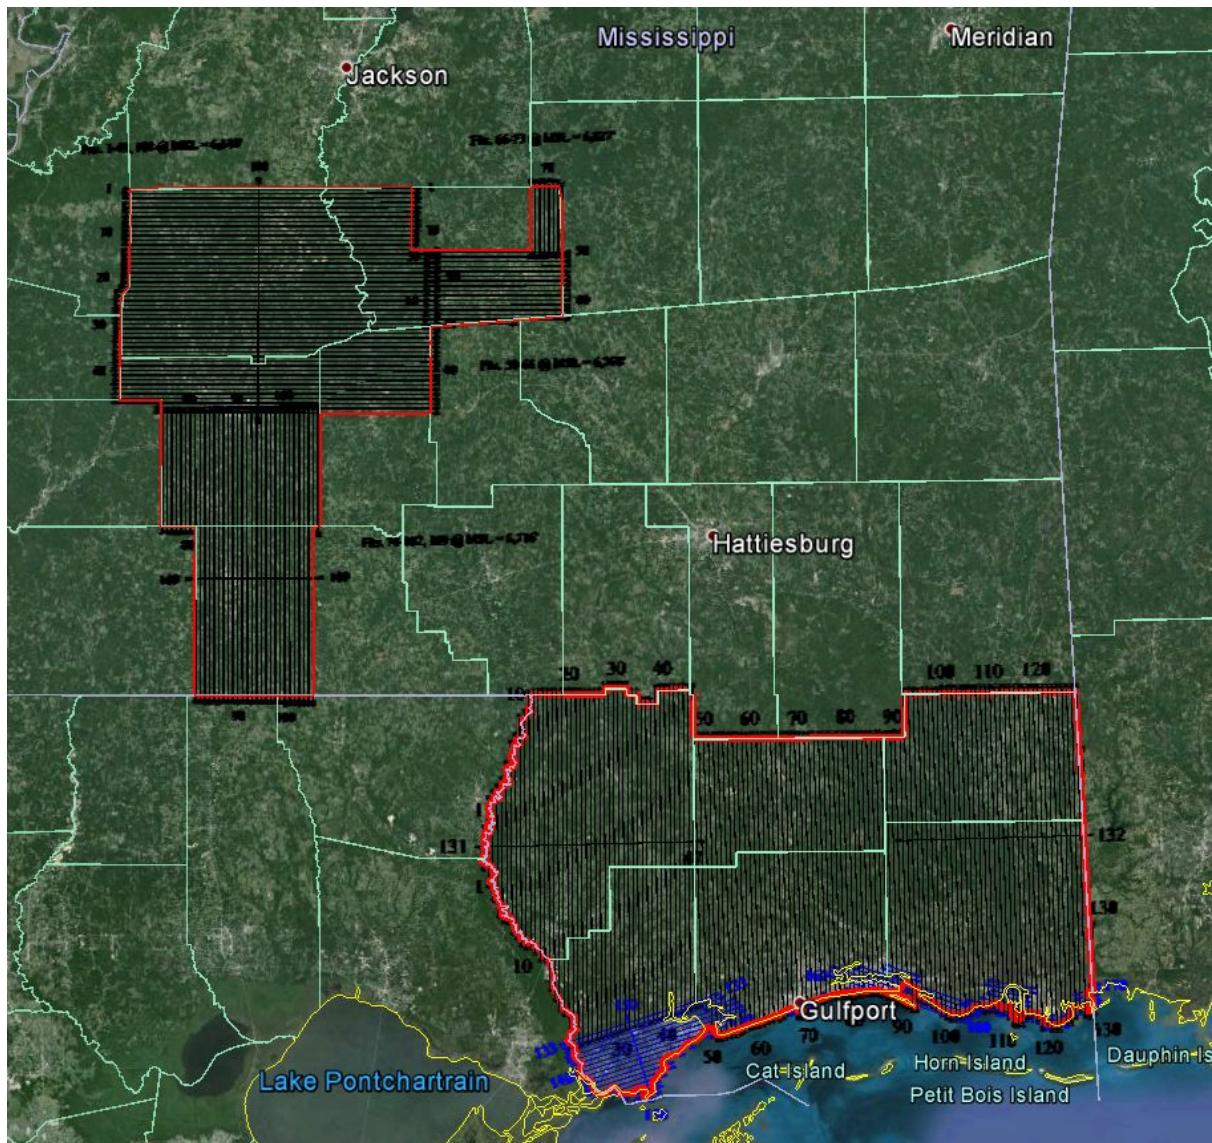

Prior to mobilizing to the project site, flight crews coordinated with the necessary Air Traffic Control personnel to ensure airspace access.

Woolpert survey crews were onsite, operating a Global Navigation Satellite System (GNSS) Base Station for the airborne GPS support.

The lidar data was collected in Thirty-one (31) separate missions, flown as close together as the weather permitted, to ensure consistent ground conditions across the project area.

An initial quality control process was performed immediately on the lidar data to review the data coverage, airborne GPS data, and trajectory solution. Any gaps found in the lidar data were relayed to the flight crew, and the area was re-flown.

# Section 3: Lidar Data Processing

## Applications and Work Flow Overview

1. Resolved kinematic corrections for three subsystems: inertial measurement unit (IMU), sensor orientation information and airborne GPS data. Developed a blending post-processed aircraft position with attitude data using Kalman filtering technology or the smoothed best estimate trajectory (SBET).  
**Software:** POSPac Software v. 5.3, IPAS Pro v.1.35.
2. Calculated laser point position by associating the SBET position to each laser point return time, scan angle, intensity, etc. Created raw laser point cloud data for the entire survey in LAS format. Automated line-to-line calibrations were then performed for system attitude parameters (pitch, roll, heading), mirror flex (scale) and GPS/IMU drift.  
**Software:** ALS Post Processing Software v.2.75 build #25, Proprietary Software, TerraMatch v. 15.01., Leica Lidar Survey Studio (LSS)
3. Imported processed LAS point cloud data into the task order tiles. Resulting data were classified as ground and non-ground points with additional filters created to meet the task order classification specifications. Statistical absolute accuracy was assessed via direct comparisons of ground classified points to ground RTK survey data. Based on the statistical analysis, the lidar data was then adjusted to reduce the vertical bias when compared to the survey ground control.  
**Software:** TerraScan v.15.01.
4. The LAS files were evaluated through a series of manual QA/QC steps to eliminate remaining artifacts from the ground class.  
**Software:** TerraScan v.15.01.

## Global Navigation Satellite System (GNSS) – Inertial Measurement Unit (IMU) Trajectory Processing

### Equipment

Flight navigation during the lidar data acquisition mission is performed using IGI CCNS (Computer Controlled Navigation System). The pilots are skilled at maintaining their planned trajectory, while holding the aircraft steady and level. If atmospheric conditions are such that the trajectory, ground speed, roll, pitch and/or heading cannot be properly maintained, the mission is aborted until suitable conditions occur.

The aircraft are all configured with a NovAtel Millennium 12-channel, L1/L2 dual frequency Global Navigation Satellite System (GNSS) receivers collecting at 2 Hz.

All Woolpert aerial sensors are equipped with a Litton LN200 series Inertial Measurement Unit (IMU) operating at 200 Hz.

A base-station unit was mobilized for each acquisition mission where a CORS station was not utilized, and was operated by a member of the Woolpert acquisition team. Each base-station setup consisted of one Trimble 4000 – 5000 series dual frequency receiver, one Trimble Compact L1/L2 dual frequency antenna, one 2-meter fixed-height tripod, and essential battery power and cabling. Ground planes were used on the base-station antennas. Data was collected at 1 or 2 Hz.

The Chiroptera II system includes a NovAtel SPAN GNSS system with an LCI-100C IMU for aircraft position and orientation. Flight lines are shown on a pilots display, and the aircraft is controlled by the pilots at all times. Information from the IMU are also used in real-time by the PAV100 gyro-stabilized mount to compensate for deviations in pitch and roll.

The GNSS base station operated during the Lidar acquisition missions is listed below:

**Table 3.1: GNSS Base Station****Woolpert**

| Station<br>(Name)        | Latitude<br>(DMS) | Longitude<br>(DMS) | Ellipsoid Height (L1 Phase center)<br>(Meters) |

## Data Processing

All airborne GNSS and IMU data was post-processed and quality controlled using Applanix MMS software. GNSS data was processed at a 1 and 2 Hz data capture rate and the IMU data was processed at 200 Hz.

Position and orientation data were acquired in the aircraft using a NovAtel SPAN with LCI-100C IMU. All data were post-processed using NovAtel Inertial Explorer software to provide a tightly-coupled kinematic position and orientation solution.

## Trajectory Quality

The GNSS Trajectory, along with high quality IMU data are key factors in determining the overall positional accuracy of the final sensor data. Within the trajectory processing, there are many factors that affect the overall quality, but the most indicative are the Combined Separation, the Estimated Positional Accuracy, and the Positional Dilution of Precision (PDOP).

Figure 3.1: Trajectory, Day03015\_SH7177

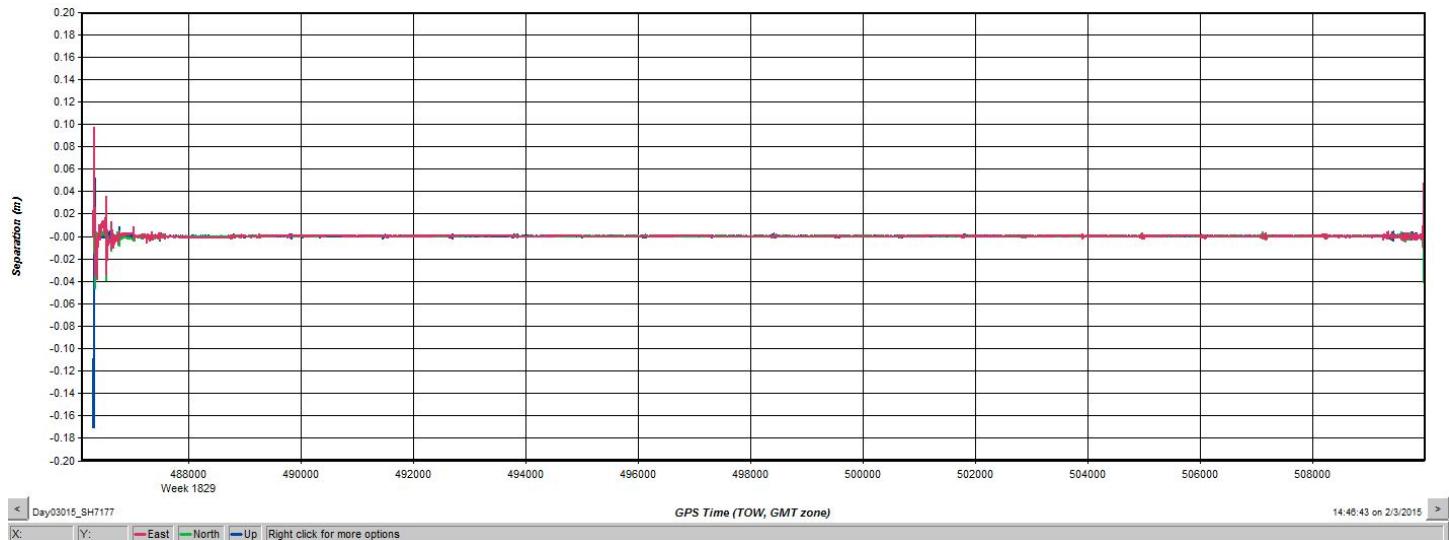

## Combination Separation

The Combined Separation is a measure of the difference between the forward run and the backward run solution of the trajectory. The Kalman filter is processed in both directions to remove the combined directional anomalies. In general, when these two solutions match closely, an optimally accurate reliable solution is achieved.

Woolpert's goal is to maintain a Combined Separation Difference of less than ten (10) centimeters. In most cases we achieve results below this threshold.

Figure 3.2: Combined Separation, Day03015\_SH7177

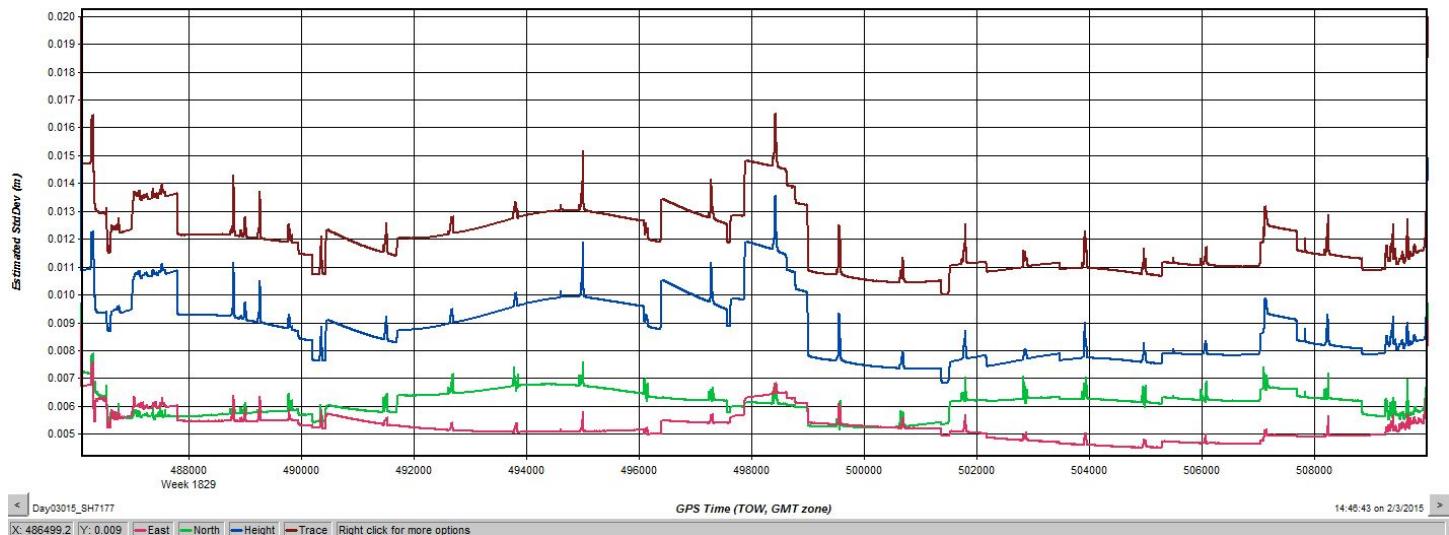

## Estimated Positional Accuracy

The Estimated Positional Accuracy plots the standard deviations of the east, north, and vertical directions along a time scale of the trajectory. It illustrates loss of satellite lock issues, as well as issues arising from long baselines, noise, and/or other atmospheric interference.

Woolpert's goal is to maintain an Estimated Positional Accuracy of less than ten (10) centimeters, often achieving results well below this threshold.

Figure 3.3: Estimated Positional Accuracy, Day03015\_SH7177

## PDOP

The PDOP measures the precision of the GPS solution in regards to the geometry of the satellites acquired and used for the solution. Woolpert's goal is to maintain an average PDOP value below 3.0. Brief periods of PDOP over 3.0 are acceptable due to the calibration and control process if other metrics are within specification.

Figure 3.4: PDOP, Day03015\_SH7177

## Lidar Data Processing

When the sensor calibration, data acquisition, and GPS processing phases were complete, the formal data reduction processes by Woolpert lidar specialists included:

- Processed individual flight lines to derive a raw “Point Cloud” LAS file. Matched overlapping flight lines, generated statistics for evaluation comparisons, and made the necessary adjustments to remove any residual systematic error.
- Calibrated LAS files were imported into the task order tiles and initially filtered to create a ground and non-ground class. Then additional classes were filtered as necessary to meet client specified classes.
- Once all project data was imported and classified, survey ground control data was imported and calculated for an accuracy assessment. As a QC measure, Woolpert has developed a routine to generate accuracy statistical reports by comparisons against the TIN and the DEM using surveyed ground control of higher accuracy. The lidar is adjusted accordingly to meet or exceed the vertical accuracy requirements.
- The lidar tiles were reviewed using a series of proprietary QA/QC procedures to ensure it fulfills the task order requirements. A portion of this requires a manual step to ensure anomalies have been removed from the ground class.
- The lidar LAS files are classified into the Default (Class 1), Ground (Class 2), Low Noise (Class 7), Water (Class 9), Ignored Ground (Class 10), Bridge Decks (Class 17) and High Noise (Class 18) classifications.
- FGDC Compliant metadata was developed for the task order in .xml format for the final data products.
- The horizontal datum used for the 3DEP Extension data was referenced to UTM15N North American Datum of 1983 (2011) and UTM16N North American Datum of 1983 (2011). The vertical datum used for the task order was referenced to NAVD 1988, meters, GEOID12A. Coordinate positions were specified in units of meters.
- The horizontal datum used for Coastal delivery was referenced to Mississippi State Plane East Zone, NAD83(2011). The vertical datum used for the task order was referenced to NAVD88, GEOID12A/12B in units of US Survey Feet.

# Section 4: Hydrologic Flattening

## HYDROLOGIC FLATTENING OF LIDAR DEM DATA

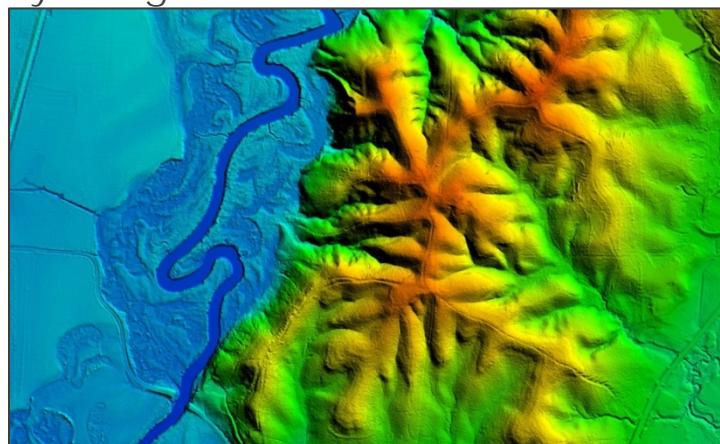

Mississippi Coastal QL2 Lidar with 3DEP Extension Lidar processing task order required the compilation of breaklines defining water bodies and rivers. The breaklines were used to perform the hydrologic flattening of water bodies, and gradient hydrologic flattening of double line streams and rivers. Lakes, reservoirs and ponds, at a minimum size of 2-acre or greater, were compiled as closed polygons. The closed water bodies were collected at a constant elevation. Rivers and streams, at a nominal minimum width of 30 meters (100 feet), were compiled in the direction of flow with both sides of the stream maintaining an equal gradient elevation. One coastal elevation was applied to entire project area. Due to differing acquisition dates and thus differing tide levels there will be areas in the DEM exhibiting what appears to be "digging" water features.

## LIDAR DATA REVIEW AND PROCESSING

Woolpert utilized the following steps to hydrologically flatten the water bodies and for gradient hydrologic flattening of the double line streams within the existing lidar data.

1. Woolpert used the newly acquired lidar data to manually draw the hydrologic features in a 2D environment using the lidar intensity and bare earth surface. Open Source imagery was used as reference when necessary.
2. Woolpert utilizes an integrated software approach to combine the lidar data and 2D breaklines. This process "drapes" the 2D breaklines onto the 3D lidar surface model to assign an elevation. A monotonic process is performed to ensure the streams are consistently flowing in a gradient manner. A secondary step within the program verifies an equally matching elevation of both stream edges. The breaklines that characterize the closed water bodies are draped onto the 3D lidar surface and assigned a constant elevation at or just below ground elevation.
3. The lakes, reservoirs and ponds, at a minimum size of 1-acre or greater and streams at a minimum size of 30 meters (100 feet) nominal width, were compiled to meet task order requirements. **Figure 4.1** illustrates an example of 30 meters (100 feet) nominal streams identified and defined with hydrologic breaklines. The breaklines defining rivers and streams, at a nominal minimum width of 30 meters (100 feet), were draped with both sides of the stream maintaining an equal gradient elevation.
4. All ground points were reclassified from inside the hydrologic feature polygons to water, class nine (9).
5. All ground points were reclassified from within a buffer along the hydrologic feature breaklines to buffered ground, class ten (10).
6. The lidar ground points and hydrologic feature breaklines were used to generate a new digital elevation model (DEM).

Figure 4.1: Example Hydrologic Breaklines

**Figure 4.2** reflects a DEM generated from original lidar bare earth point data prior to the hydrologic flattening process. Note the “tinning” across the lake surface.

**Figure 4.3** reflects a DEM generated from lidar with breaklines compiled to define the hydrologic features. This figure illustrates the results of adding the breaklines to hydrologically flatten the DEM data. Note the smooth appearance of the lake surface in the DEM.

**Figure 4.2**

**Figure 4.3**

Terrascan was used to add the hydrologic breakline vertices and export the lattice models. The hydrologically flattened DEM data was provided to USGS in ERDAS .IMG format.

The hydrologic breaklines compiled as part of the flattening process were provided to the USGS as an ESRI Shapefile. The breaklines defining the water bodies greater than 2-acre and for the gradient flattening of all rivers and streams at a nominal minimum width of 30 meters (100 feet) were provided as a Polygon-Z feature class.

## DATA QA/QC

Initial QA/QC for this task order was performed in Global Mapper v15, by reviewing the grids and hydrologic breakline features. Additionally, ESRI software and proprietary methods were used to review the overall connectivity of the hydrologic breaklines.

Edits and corrections were addressed individually by tile. If a water body breakline needed to be adjusted to improve the flattening of the DEM data, the area was cross referenced by tile number, corrected accordingly, a new DEM file was regenerated and reviewed.

# Section 5: ACCURACY ASSESSMENT

## Accuracy Assessment

This section contains accuracy assessments for both the 3DEP Extension AOI and the MS Coastal QL2 AOI. The vertical accuracy statistics were calculated by comparison of the lidar bare earth points to the ground surveyed QA/QC points. 3DEP Extension Lidar was processed and delivered in NAD1983(2011) UTM16, NAVD88 Geoid12A meters. A portion of the AOI falls into the UTM 15 zone. Data deliverables were reprojected and also delivered in NAD1983(2011) UTM16, NAVD88 Geoid12A meters. It should be noted that accuracy analysis was reported for the UTM15 data delivery. The Coastal delivery was processed and projected in Mississippi State Plane East Zone, NAD83(2011). The vertical datum used for the task order was referenced to NAVD88, GEOID12A/12B in units of US Survey Feet.

**Table 5.1: Overall Vertical Accuracy Statistics**

### 3DEP Extension

|                    |        |       |
|--------------------|--------|-------|
| Average error      | 0.061  | meter |
| Minimum error      | -0.119 | meter |
| Maximum error      | 0.202  | meter |
| Average magnitude  | 0.071  | meter |
| Root mean square   | 0.085  | meter |
| Standard deviation | 0.060  | meter |

## VERTICAL ACCURACY CONCLUSIONS

Raw Swath Non-Vegetated Vertical Accuracy (NVA) Tested 0.166 meters Non-Vegetated Vertical Accuracy (NVA) at a 95 percent confidence level, derived according to NSSDA, in open terrain using  $(RMSE_z) \times 1.96000$  as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the TIN using all points.

LAS Swath Non-Vegetated Vertical Accuracy (NVA) Tested 0.158 meters Non-Vegetated Vertical Accuracy (NVA) at a 95 percent confidence level, derived according to NSSDA, in open terrain using  $(RMSE_z) \times 1.96000$  as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the TIN using ground points.

## VERTICAL ACCURACY CONCLUSIONS

Bare-Earth DEM Non-Vegetated Vertical Accuracy (NVA) Tested 0.158 meters Non-Vegetated Vertical Accuracy (NVA) at a 95 percent confidence level, derived according to NSSDA, in open terrain using  $(RMSE_z) \times 1.96000$  as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the DEM.

## VERTICAL ACCURACY CONCLUSIONS

Non-Vegetated Vertical Accuracy (VVA) Tested 0.168 meters at the 95th percentile reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the DEM. VVA Errors larger than 95th percentile include:

Point 3001, Easting 724004.291, Northing 3548233.071, Z-Error 0.225 meters  
 Point 3006, Easting 787079.316, Northing 3534453.052, Z-Error 0.219 meters  
 Point 3008, Easting 731607.602, Northing 3523320.522, Z-Error 0.218 meters  
 Point 3020, Easting 815952.763, Northing 3545965.053, Z-Error 0.311 meters  
 Point 3026, Easting 757776.203, Northing 3521057.809, Z-Error 0.174 meters  
 Point 3029, Easting 741501.653, Northing 3481028.863, Z-Error 0.172 meters  
 Point 3031, Easting 725518.905, Northing 3472151.735, Z-Error 0.216 meters  
 Point 3032, Easting 746673.921, Northing 3459245.033, Z-Error 0.207 meters  
 Point 3035, Easting 761124.855, Northing 3434361.214, Z-Error 0.170 meters  
 Point 3037, Easting 721337.070, Northing 3543363.166, Z-Error 0.218 meters  
 Point 3038, Easting 734564.219, Northing 3529225.023, Z-Error 0.296 meters  
 Point 3040, Easting 768433.956, Northing 3500227.496, Z-Error 0.198 meters  
 Point 3041, Easting 780357.999, Northing 3545844.660, Z-Error 0.261 meters  
 Point 3049, Easting 746635.337, Northing 3529305.001, Z-Error 0.185 meters

**Table 5.5: Overall Vertical Accuracy Statistics****Coastal**

|                    |        |         |
|--------------------|--------|---------|
| Average error      | 0.064  | US feet |
| Minimum error      | - 0.42 | US feet |
| Maximum error      | 0.51   | US feet |
| Average magnitude  | 0.141  | US feet |
| Root mean square   | 0.141  | US feet |
| Standard deviation | 0.169  | US feet |

## VERTICAL ACCURACY CONCLUSIONS

Raw Swath Non-Vegetated Vertical Accuracy (NVA) Tested 0.355 US feet Non vegetated vertical accuracy at a 95 percent confidence level, derived according to NSSDA, in open terrain using  $(RMSE_z) \times 1.96000$  as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the TIN using all points.

LAS Swath Non-Vegetated Vertical Accuracy (NVA) Tested 0.347 US feet Non vegetated vertical accuracy at a 95 percent confidence level, derived according to NSSDA, in open terrain using  $(RMSE_z) \times 1.96000$  as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the TIN using ground points.

## SUPPLEMENTAL VERTICAL ACCURACY ASSESSMENTS

**Table 5.7: Non-Vegetated Vertical Accuracy Quality Check Point Analysis NVA  
Coastal**

## VERTICAL ACCURACY CONCLUSIONS

Bare-Earth DEM Non-Vegetated Vertical Accuracy (NVA) Tested 0.361 US feet Non-Vegetated vertical accuracy at a 95 percent confidence level, derived according to NSSDA, in open terrain using  $(RMSE_z) \times 1.96000$  as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the DEM.

**Table 5.8: Vegetated Vertical Accuracy Quality Check Point Analysis VVA  
Coastal**

| Point ID | Easting (US feet) | Northing (US feet) | DEM Elevation (US feet) | Dz (US feet) |

## VERTICAL ACCURACY CONCLUSIONS

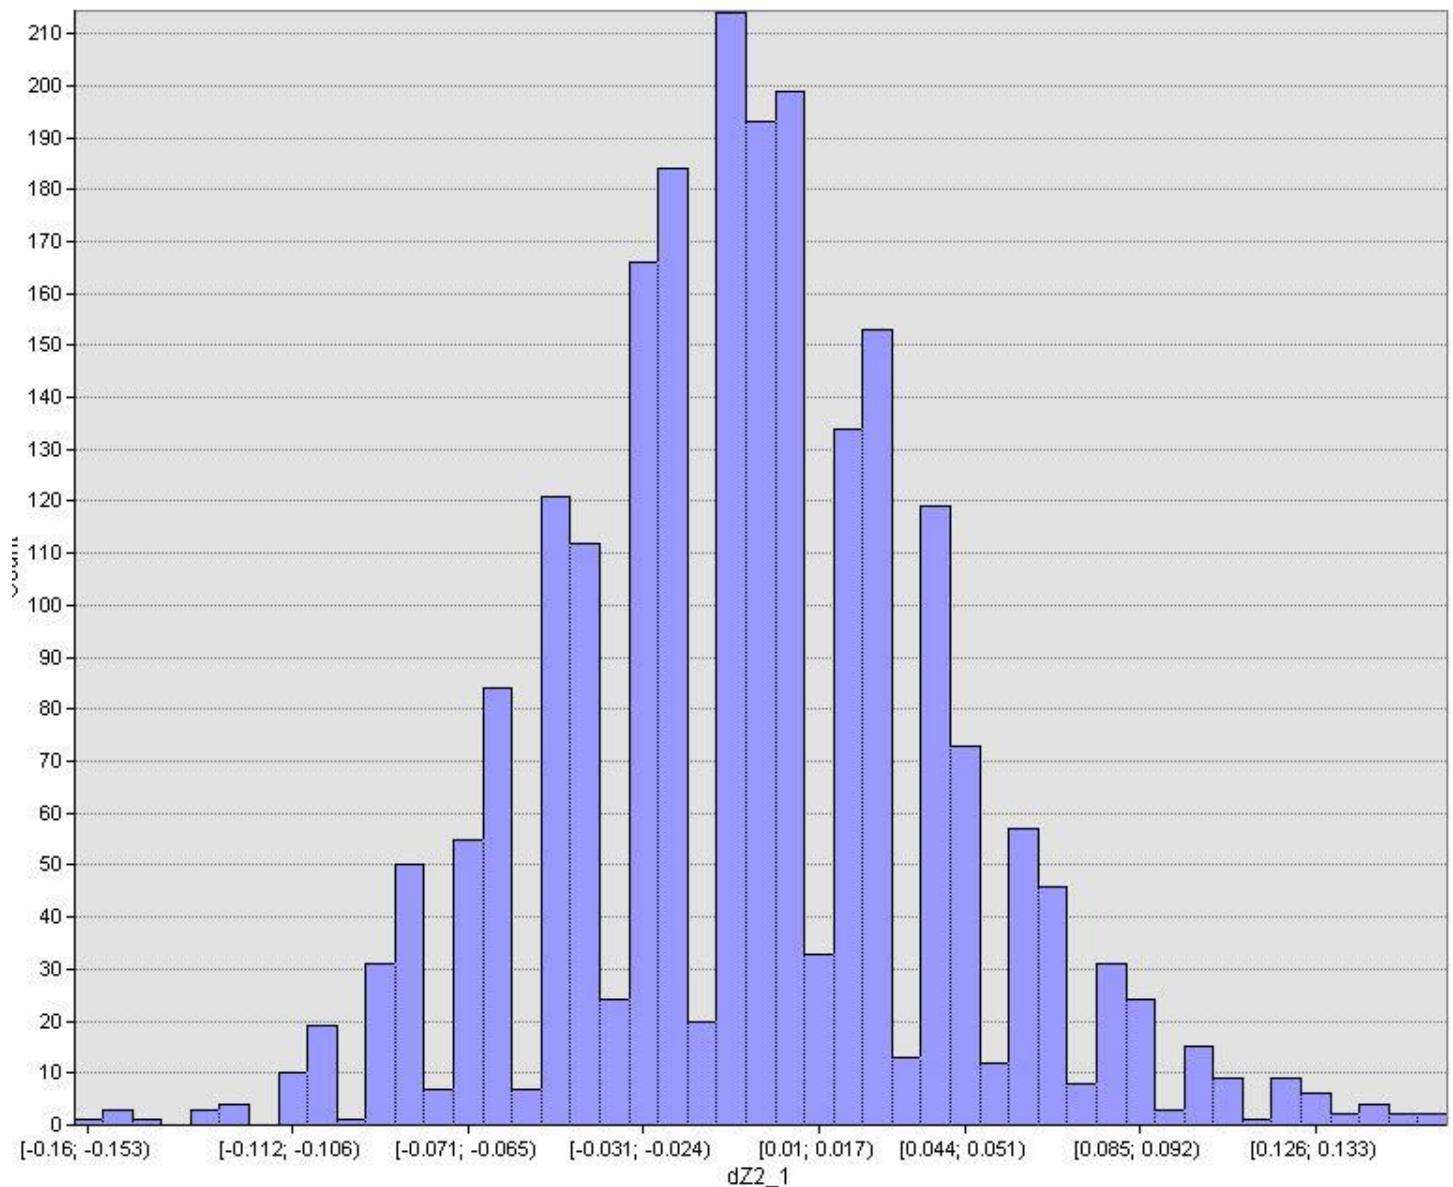

Vegetated Vertical Accuracy (VVA) Tested 0.813 US feet at the 95th percentile reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the DEM. VVA Errors larger than 95th percentile include:

Point 3006, Easting 877698.930, Northing 511196.730, Z-Error 0.901 US feet  
 Point 3049A, Easting 999096.100, Northing 462616.620, Z-Error 0.920 US feet  
 Point 3055, Easting 1076208.030, Northing 373193.260, Z-Error 0.900 US feet  
 Point 3055A, Easting 1076234.340, Northing 373087.770, Z-Error 0.850 US feet  
 Point 3060A, Easting 996995.250, Northing 346375.120, Z-Error 0.940 US feet  
 Point 3062, Easting 961640.000, Northing 384641.660, Z-Error 1.080 US feet  
 Point 3066A, Easting 889758.560, Northing 407986.760, Z-Error 0.861US feet  
 Point 3071A, Easting 685891.180, Northing 386513.930, Z-Error 0.830 US feet

## RELATIVE ACCURACY ASSESSMENT AND CONCLUSION

Relative accuracy also known as "between swath" accuracy was tested through a series of well distributed flight line overlap locations. The relative accuracy for the Mississippi Coastal QL2 Lidar with 3DEP Extension tested at 0.055 meters RMSDz.

Figure 5.1: Relative Accuracy Histogram, Mississippi Coastal QL2 Lidar with 3DEP Extension Lidar

| 5:07  | 76                                   | W       |  |                   |       |
| 5:15  | 75                                   | E       |  |                   |       |
| 5:25  | 74                                   | W       |  |                   |       |
| 5:36  | 73                                   | E       |  |                   |       |
| 5:48  | 72                                   | W       |  |                   |       |
| 6:01  | 71                                   | E       | Back reflection alarm prior to SOL- rerun just in case |                   |       |
| 6:13  | 70                                   | W       |  |                   |       |
| 6:26  | 69                                   | E       |  |                   |       |
| 6:38  | 68                                   | W       | Small cloud below aircraft in area data not required   |                   |       |
| 6:50  | 67                                   | E       | Ceiling dropping- reduce altitude 50 feet              |                   |       |
| 7:02  | 66                                   | W       | Ended early before EOL -in clouds                      |                   |       |
|   |                                      |         | Looked over rest of area. Clouds too low.              |                   |       |
|   |                                      |         | Return to Trent Lott.                                  |                   |       |

# Section 7: Final Deliverables

The final lidar deliverables are listed below.

- LAS v1.4 classified point cloud
- LAS v1.4 raw unclassified point cloud flight line strips.
- **Hydro Breaklines as ESRI shapefile**
- Digital Elevation Model in ERDAS .IMG format
- 8-bit intensity images in .TIF format
- Tile layout and data extent provided as ESRI shapefile
- Control Points provided as ESRI shapefile
- Flight line vectors provided as ESRI shapefile
- FGDC compliant metadata per product in XML format
- Lidar processing report in pdf format
- Survey report in pdf format
