LiDAR SUPPORT BROWARD, GLADES, HENDRY, MARTIN, OKEECHOBEE AND PALM COUNTIES, FLORIDA SURVEY SUMMARY

In mid August of 2007, GCT Inc received the contract requirements to perform LiDAR support for Merrick and Company. The contract requirements included establishment, location and documentation of 500 photo-identifiable (photo –id) checkpoints and vertical accuracy check (ground truthing) points spread out over approximately 2,263 square miles. In addition to the establishment of the required points, GCT Inc was also tasked with providing GPS support for the data acquisition by manning pre-determined ground station control points during actual flight times. To best accomplish these tasks, multiple field crews and support personnel were assigned to the project, with specific tasks set to each.

To begin the main photo control network, William Wright and crew started with the reconnaissance of existing horizontal and vertical control in and around the project area. In addition to recon, Wright and crew were tasked with setting the photo-id points as near as possible to the locations provided by Merrick. Due to poor GPS "windows" and/or poor access at much of the recovered vertical control monumentation, Wright and crew also transferred elevations to set photo-id points or newly set monumentation to achieve the necessary density needed for the establishment of the Primary Control Network. Digital photos and point description sketches of each photo-id point were also collected at this time. With all photo-id points set, additional personnel were mobilized to perform the static GPS observations. The primary control network GPS data collection was performed using eight Trimble dual frequency GPS receivers running simultaneously for a minimum of 30 minutes per session.

The Urban area, open terrain, and bare ground vertical check points were set and locations determined by Jason Tucker and crew. Static GPS techniques were employed in the location of these points, with ties made to the primary control network. The average static session was performed for approximately 20 minutes on these points.

The Forest and Mature crop areas of the project made the use of static GPS techniques nearly impossible. As a result of this, Chad Evans and crew, with help from Will Wright and crew, utilized Real Time Kinematic (RTK) GPS to establish accurate positional information on the ground truthing points in these areas.

 AD0692.The horizontal coordinates were established by GPS observations
 AD0692.and adjusted by the National Geodetic Survey in April 2001.
 AD0692
 AD0692.The orthometric height was determined by differential leveling
 AD0692.and adjusted by the NATIONAL GEODETIC SURVEY in September 1992.
 AD0692.WARNING-Repeat measurements at this control monument indicate possible

 AD0692.The X, Y, and Z were computed from the position and the ellipsoidal ht.
 AD0692
 AD0692.The Laplace correction was computed from DEFLEC99 derived deflections.
 AD0692
 AD0692.The ellipsoidal height was determined by GPS observations
 AD0692.and is referenced to NAD 83.
 AD0692
 AD0692.The geoid height was determined by GEOID03.
 AD0692
 AD0692.The dynamic height is computed by dividing the NAVD 88
 AD0692.geopotential number by the normal gravity value computed on the

AJ6203.The horizontal coordinates were established by GPS observations
AJ6203.and adjusted by the National Geodetic Survey in February 2007.
AJ6203
AJ6203.The datum tag of NAD 83(2007) is equivalent to NAD 83(NSRS2007).
AJ6203.See National Readjustment for more information.
AJ6203.The horizontal coordinates are valid at the epoch date displayed above.
AJ6203.The epoch date for horizontal control is a decimal equivalence
AJ6203.of Year/Month/Day.
AJ6203
AJ6203.The orthometric height was determined by differential leveling
AJ6203.and adjusted in January 2002.
AJ6203
AJ6203.The X, Y, and Z were computed from the position and the ellipsoidal ht.
AJ6203
AJ6203.The Laplace correction was computed from DEFLEC99 derived deflections.
AJ6203
AJ6203.The ellipsoidal height was determined by GPS observations
AJ6203.and is referenced to NAD 83.
AJ6203
AJ6203.The geoid height was determined by GEOID03.
AJ6203
AJ6203.The dynamic height is computed by dividing the NAVD 88
AJ6203.geopotential number by the normal gravity value computed on the
AJ6203.Geodetic Reference System of 1980 (GRS 80) ellipsoid at 45
AJ6203.degrees latitude (g = 980.6199 gals.).
AJ6203
AJ6203.The modeled gravity was interpolated from observed gravity values.
